EXECUTIVE SUMMARY

Violence against children impacts every second child in the world, jeopardising their health, education, and social relationships. Its global scale and its effect on every element of children's lives has prompted action from national policymakers, development partners and donors alike – however, much more remains to be done.

Ending violence against children is among the top issues included in the Agenda 2030, leading over 30 governments to declare their intention to prioritise the objective; yet still, these commitments have not been followed by the political actions and investments needed to protect children's futures.

The evidence clearly shows ending violence against children is a seriously underfunded issue, both at national and global levels. This lack of funding and implementation is an increasingly concerning trend. The combined impacts of the COVID-19 pandemic, conflicts, and climate change have exponentially increased the risks of violence against children. As such, we are left with a pressing issue for donors and national governments: how to close the significant gap between the growing needs and stagnating investment to end violence against children.

This is the third in a regular series of reports investigating the state of Official Development Assistance (ODA) investment to end violence against children. Its contents are based on the latest set of data from the Organisation for Economic Co-operation and Development, Development Assistance Committee's (OECD-DAC) Creditor Reporting System (CRS) database (this edition: December 2021). The data and analysis are based on ODA spending for the year 2020.

Our findings clearly show that only a small fraction of ODA spending remains targeted at ending violence against children: 0.72% of total 2020 ODA investment (US\$1,757.3 billion) – almost a 10% decrease compared to 2018. Out of this total, only 12% (US\$278.5 million) is dedicated to projects exclusively focused on ending violence against children.

The onset of the pandemic and the events of the last two years have precipitated a devastating increase in violence against children around the world, yet even before this, the total amount of funding towards EVAC was tragically low. Despite the overall magnitude of the problem and the cost of inaction, funding also remains heavily concentrated between only a few donors and recipient countries.

The current climate of fiscal austerity as well as investment being diverted towards tackling various political, health, and environmental crises, will have disproportionately severe consequences for already-underfunded efforts to end violence against children. This is an outcome that must be avoided at all costs. This report features a series of recommendations to increase investment and to improve monitoring of ODA allocations to end violence against children.

1. INTRODUCTION

Violence against children has long-lasting and significant consequences for the wellbeing of children, bringing pain, suffering, and trauma – both in the short and long term. It leads to diminished physical and mental health, as well as eroding social relationships and interactions. It also inflicts a huge financial toll on both victims and societies, with national studies from a range of countries showing that tackling its consequences can consume up **to 5% of national GDP**.¹ Similarly, the global cost of physical, sexual, and emotional violence is estimated at being between **3% to 8% of global GDP**.²

The COVID-19 pandemic, conflict, climate change and a series of ongoing humanitarian crises have collectively placed more children at risk of violence than at any other point in the past 10 years. Every second child in the world is already affected by violence – and yet this crisis is simply becoming bigger and more urgent.

Preventing and ending violence against children clearly yields significant benefits for children and societies and future livelihoods. It is critical for achieving improved health, education, and economic outcomes, as well as breaking intergenerational cycles of violence and closing gender equality gaps.

What is violence against children?

The World Health Organization (WHO) describes violence as the “intentional use of physical force or power, threatened or actual, against oneself, another person, or against a group or community, which results in, or has a high likelihood of resulting in, injury, death, psychological harm, mal-development, or deprivation.”

The Convention on the Rights of the Child says States have an obligation to take all appropriate measures to “protect the child from all forms of physical or mental violence, injury or abuse, neglect or negligent treatment, maltreatment or exploitation, including sexual abuse. Such measures shall be undertaken “to the maximum extent of their available resources and, where needed, within the framework of international co-operation.”

Violence against children takes a multitude of forms, including, but not limited to, child marriage, child labour, corporal punishment, sexual violence, sexual abuse and exploitation, bullying, gang and conflict-related violence, and violence facilitated by technology, such as cyberbullying, sexual extortion and online sexual exploitation and abuse.

A problem of this magnitude requires strong action and investment from national policymakers and donors. Our interagency group has been monitoring investments made towards ending violence against children and actively advocating for donors and policymakers alike to meet their commitments.

Over the years, we have seen an increase in commitments and improvement of international standards, including the articulation of specific targets on ending violence against children in Agenda 2030. An increasing number of pathfinding countries are pledging to prioritise ending violence against children and there is more evidence of effective interventions to stop the practice.³

Despite all these achievements and pledges, there has been no significant increase in investment to end violence. Ending childhood violence enables millions of children to live in a safe environment and contribute to the wellbeing and prosperous future of their respective societies.

For the first time in decades, child labour and child marriage are projected to rise, threatening the significant progress achieved over the last 10 years; meanwhile, new threats via the internet are increasingly placing children at risk of sexual violence and exploitation⁴. The main issue thus remains: how can we close the significant gap between children’s growing need for protection and stagnating investment by donors and national governments?

This report focuses on Official Development Assistance (ODA) allocations to ending violence against children and is based on the latest set of data (December 2021) from the Organisation for Economic Co-operation and Development, Development Assistance Committee’s (OECD-DAC) Creditor Reporting System (CRS) database. This is the third report in the *Counting Pennies* series. Our first report established a baseline for investment in ending violence against children after the launch of Agenda 2030.⁵ The second took stock of how investment changed in the first three years of the agenda’s implementation, adding analysis of spending on the different INSPIRE strategies and Sustainable Development

³ Pathfinding Countries are those who have made public commitments to accelerate progress in ending violence against children as a part of their Agenda 2030 implementation. The full list can be found here: <https://www.end-violence.org/pathfinding-countries>

DEFINING ODA

ODA is defined as government aid that promotes and specifically targets the economic development and welfare of developing countries. Its calculation and reporting is defined by the Development Assistance Committee (DAC) of the Organisation for Economic Co-operation and Development (OECD). Data collected by the DAC is the principal measure used in most aid targets and assessments of aid performance. For any expenditure or other transfer of resources to qualify as ODA, it must meet the following criteria:

1. It must benefit countries on the Development Assistance Committee list of ODA recipients. This can include funding of global initiatives intended to benefit these countries.
2. It is provided by official agencies, meaning government departments and their agencies. ODA receipts also include disbursements from the core funds of multilateral bodies, such as the World Bank, United Nations agencies, and regional development banks.
3. Its main objective is to promote the economic development and welfare of developing countries.
4. Any funding is concessional in character. In practice this means that ODA is limited to grant funding and concessional loans. It should be noted that all ODA to end violence against children identified by this study was in the form of grants.

Goal (SDG) targets related to ending violence against children.⁶ This third *Counting Pennies* report examines investment in ending violence against children in the first year of the COVID-19 pandemic, providing initial data on how it has influenced donor investments.

The absence of specific trackers in ODA spending on ending violence against children, means that the data for this report were analysed manually, using relevant keyword searches to scan and analyse project entries. This shortcoming in tracking has been a common issue for all three *Counting Pennies* reports.

This report analyses key recipients, donors, and areas of investment. It underlines the discrepancies between the costs and magnitude of violence against children and the inadequate level of investment in prevention and response; it also makes key recommendations to improve the monitoring of ODA investment in EVAC.

The main findings are discussed below; the full data set has also been made available for individual use and analysis online. Visit <https://www.wvi.org/counting-pennies> for the interactive data portal.

⁶ The INSPIRE technical package is seven evidence-based strategies for ending violence against children that have shown success in reducing the phenomenon. They are: implementation and enforcement of laws; norms and values; safe environments; parent and caregiver support; income and economic strengthening; response and support services; and education and life skills. For more information, see: <https://www.wvi.org/publications/i/item/inspire-seven-strategies-for-ending-violence-against-children>

2. KEY FINDINGS AND RECOMMENDATIONS

The evidence shows that only a small fraction of ODA spending is targeted at ending violence against children: **US\$1,757.3 billion (0.78%)** of the total 2020 ODA investment.⁷ Out of this figure, only **12% (US\$278.5 million)** is dedicated to projects that specifically focus on ending violence against children. The balance goes towards projects that address violence against children as part of a broader set of objectives or efforts to end violence against both children and adults.

Despite children's increased vulnerability and risks over the last two years, ODA investment to end violence against children has decreased by 10% since 2018. **Spending on projects that solely address violence against children is 50% lower in 2020 compared with 2018.** This decrease is consistent with the overall drop (26%) of ODA from bilateral donors in 2020; these donors traditionally provide the majority of ODA towards EVAC. The dominant shift over the past few years has been from bilateral donors to investments by international financial institutions (IFIs). This funding change has dominated ODA trends but has had very little impact on EVAC investment, given the very small number of IFI commitments to EVAC. As an indication, in 2020 only US\$6.5 million (less than 0.3%) of total ODA investment into EVAC was provided by IFIs.⁸

⁷ The data in the table is corrected for 2020 prices to allow more accurate comparison.

⁸ Development Initiatives (2022), ODA 2020–2021: Key trends before and during emerging crises, <https://devinit.org/resources/oda-2020-2021-key-trends-before-during-emerging-crises/?nav=more-about>

Source: Authors' analysis of OECD CRS ODA 2017, 2018 and 2020 database and Counting Pennies report (2017)

The total amount of ODA investment per child has decreased since 2018 from US\$0.68 to US\$0.64 per child. This suggests that a decrease in funding came with a decrease of geographical reach of EVAC-related projects.

The vast majority of ODA for ending violence against children comes from just 10 donors, who account for over four-fifths (approx. 86%) of total investment. These 10 donors tend to direct their funding towards addressing violence against children in association with other objectives, rather than prioritising it as a standalone funding priority. As a result, the 10 donors account for only 13% of ODA investment solely targeted to end violence against children. Apart from Canada (12%), all other donors spend less than 7% of their total ODA on ending violence against children.

Donors' investment decisions continue to be largely driven by humanitarian crises. Most spending still targets countries with large-scale conflicts, as well as those facing or hosting displaced populations as a result of conflict. In 2020, nearly 36% of the ODA investment to end violence against children went towards 9 conflict-affected and fragile countries in the Middle East, Sub-Saharan Africa, and South Asia.

Despite this geographical focus, even this funding covers only a small fraction of the identified child protection needs in most humanitarian contexts. In 2020, there was a 12% increase in child protection-specific funding from 2018, however the scope of identified needs covered dropped significantly – from 42% to 24% – compared to 2018.⁹ This is another example of how investment in ending violence is lagging behind the massive increase in children's protection needs.

The highest amount of EVAC funding has been categorised as 'bilateral' or 'unspecified'. This means the beneficiary is not a country or region and funding is allocated to non-country programmable aid, such as administrative costs, refugees in donor countries and research costs.¹⁰ As such, this expenditure may not even reach developing countries.

Since March 2020, the COVID-19 pandemic has significantly increased the prevalence of violence against children. After many years of improvements, for the first time in decades, there was concern about increases in child labour, child marriage and evidence pointing towards the increase of violence online and at home.¹¹

Our analysis shows that 10% of total funding for ending violence against children included

response to the pandemic. The top 10 donors devoted between 2% and 24.5% of ODA to EVAC addressing the impact of the pandemic. However, with the exception of Sweden, only a very small percentage of this funding went towards EVAC-specific interventions. Investment in ending child labour and child marriage remained almost unchanged, regardless of the increased estimates of prevalence due to the pandemic.¹²

ODA investment in pathfinding countries remains unchanged at slightly over 11% of total EVAC-related ODA. This adds up to just 2% of ODA when focusing on EVAC-specific projects. This tells us donors are yet to significantly support countries that have prioritised ending violence against children in their implementation of Agenda 2030.

¹⁰ Resources reported to the OECD-DAC where the beneficiary is not a country or region are reported as "bilateral/unspecified".

Top 10 recipients of ODA total and specific EVAC USD million 2020 prices (percentage of total)

Source: Authors' analysis of OECD CRS ODA 2020 database

Donor focus on prioritising access to lifesaving child protection interventions in humanitarian emergencies is commendable, though even in this area, the level of response remains deeply insufficient. The last few years have shown us the grave need for such funding in more countries and contexts than ever before. However, the low investments in addressing violence in both pathfinding and other low-income countries is also concerning—especially given the universal impact of the COVID-19 pandemic, climate change and increasing inequality and discrimination. ODA funding plays a critical and catalytic role in leveraging domestic and private investments; it is necessary to push the needle and achieve real progress in ending violence against children.

Our analysis of investment in INSPIRE-related strategies showed that 50% of EVAC funding goes to evidence-based solutions. This is certainly a welcome trend, as is the pattern of investing in multisectoral interventions that have a significant impact on preventing and addressing

violence against children. Almost 20% of all ODA for EVAC is invested in education-related interventions. Despite the promising trend, analysis of funding in this section should be treated with caution given that donors do not intentionally track this aspect.

As indicated in our previous *Counting Pennies* reports, spending on EVAC is far more likely to be gender-sensitive than is the case for ODA in general. Over four-fifths (85%) of EVAC investment has gender equity as a principal or significant objective. Many issues addressed in ending violence against children – for example ending child marriage and gender-based violence – primarily affect girls and women. This means that investing in ending violence against children has a great potential to contribute towards achieving gender equality and addressing gender-based violence.

In this report, we have again examined the use of the SDG focus fields as a potential tool

to systematically monitor investments to end violence against children. The SDG focus field is a voluntary field in the CRS database where donors can record their investment according to the sustainable development goals or targets. We have looked at all SDG focus fields representing SDG targets related to ending violence against children. The level of ODA investments in EVAC captured through SDG focus fields are significantly different from those based on keyword searches. There has been a slight improvement: in 2020 the SDG fields capture about 20% of ODA total investment in ending violence against children, as compared to 13% in 2018. Governments are clearly not using the SDG focus fields consistently for monitoring EVAC-related SDG targets, perhaps because the use of these fields is still voluntary, or because governments are prioritising other SDG targets.

This report sets out three main recommendations for action by donors and development partners:

- 1) Maintain and increase funding to end violence against children as part of an overall increase in ODA.
- 2) Agree on a standardised methodology for tracking donor investments in ending violence against children that can be integrated into the OECD-DAC CRS database.
- 3) Further research the trends identified in this report, especially related to the shift away from funding specifically targeted at violence against children.

MAINTAIN AND INCREASE FUNDING TO END VIOLENCE AGAINST CHILDREN

This report's main finding is that there has been no significant change in funding for ending violence against children since 2018. This stagnation is despite an increase in children's vulnerability and the growing prevalence of some forms of violence due to the pandemic, conflict, and climate change. When we add the magnitude of the problem and its auxiliary costs to the aforementioned, the total amount of funding is exposed as shockingly low and heavily concentrated among few donors and recipient countries.

All ODA has been impacted by a recent shift in donor priorities, a diversion largely connected to the current global atmosphere of fiscal austerity, as well diversion of funds towards managing some of the largest global crises since World War II. However, it must be underscored that directing funding away from ending violence against children has disproportionately severe consequences for all children in all societies.

It cannot be emphasised enough that investments in ending violence against children generate large social and economic dividends, as well as removing barriers to children achieving their health, educational and economic development potential.¹³ This is a dividend that resonates into the future, improving livelihoods and economies for future generations.

Photo: Dara Chhim © World Vision 2021

¹³ <https://www.wvi.org/publications/child-protection/violence-prevention-dividend>

Donors should:

Recognise the significant and catalytic role of ODA in achieving progress in ending violence against children by 2030, especially in low-income countries. Without this ODA, achievement of the SDG targets on ending violence will remain off track and generations to come will suffer.

Protect and increase investments both in humanitarian and non-humanitarian contexts. To capitalise on existing political commitments, donors should especially target countries that have demonstrated political commitment to implement VAC-prevention programmes and services (such as Pathfinding Countries) without decreasing spending in other countries. One way to ensure such investment is to replenish and increase funding directed towards the End Violence Fund for at least US\$1 billion.¹⁴

Prioritise funding towards the strengthening of national systems to prevent violence against children and scale up evidence-based solutions, such as the INSPIRE strategies.

Ensure that services are delivered through strong, gender-responsive and integrated child protection systems, as well as mechanisms that can ensure large numbers of children are reached with quality support (including in humanitarian contexts).

Along with national governments and development partners, agree to a global pledging conference on ending violence against children to tackle chronic underfunding of the sector, complementing increased bilateral ODA with new investments to replenish the End Violence Fund.

Advocate to integrate the prevention of violence against children into National Development Plans and the United Nations Sustainable Development Cooperation Frameworks, as well as post-pandemic recovery plans. This will strengthen national capacity, political will, and domestic resources for EVAC.

DEVELOP A STANDARDISED METHODOLOGY FOR TRACKING ODA INVESTMENTS IN EVAC

Measuring progress towards ending violence against children requires regular monitoring of the resources allocated to ensure they are used in the most effective way. As current monitoring mechanisms still do not adequately capture and track investments in ending violence against children, we strongly recommend, as already noted in 2017's Counting Pennies report, the adoption of a **new 'ending violence against children' policy within the OECD-DAC's database.**

In our 2017 report, we proposed two options:

A policy marker that builds on the 'children's

issues' marker used by Global Affairs Canada since 2008; this mirrors the 'gender equality' marker used by the OECD Development Assistance Committee for donor reporting of ODA. This marker will screen expenditure – both project-related and core institutional support – to check for activities that aim to improve the lives and/or promote and protect the human rights of children. While this approach may not provide a full estimate of the amount of spending on ending violence against children, it does build on OECD tracking of aid in support of gender equality and women's rights and would integrate a human rights-approach to the coding.

A second option could be the reproductive, maternal, newborn, and child health ('RMNCH') marker, introduced by the OECD-DAC for donor reporting of ODA. This marker grades each

¹⁴ <https://www.end-violence.org/fund>

project on a scale of 0-4, depending on the proportion of spending that goes to RMNCH. This method may make it easier to come up with an overall estimate of spending on ending violence against children. However, a marker that relies on project-by-project assessment would take time to be used by all donors.

Alternatively, the SDG focus field can be used to monitor the investment in ending violence against children. **OECD-DAC should make the SDG focus field mandatory**, and donors should commit to use it more consistently.

FURTHER RESEARCH TO BETTER UNDERSTAND FINDINGS OF THIS REPORT

The last two years have been very challenging for the world – including for donors. This report provides a mere snapshot of ODA spending to end violence against children, based on information available in the 2020 OECD-DAC database. It is important to further investigate how the pandemic has affected donor policies and ultimately investment choices and decisions.

Several other findings need further exploration; such as increases in funding for education within the context of ending violence against children. Moving away from funding projects with a specific purpose of EVAC to projects that address it alongside many other issues can be concerning. This trend needs to be better understood and investigated.

Whilst there is a strong rationale for funding ostensibly overlapping objectives – e.g., linking interventions in ending gender-based violence with impact on violence in childhood – the underlying issue remains as to what extent projects focusing on many objectives can achieve the desired level of impact. The ability and effectiveness of projects to prevent and address violence against children at the scale necessary to bring about enduring change also needs to be further unpacked. Such detailed analysis was not possible using the OECD-DAC database.

Ensuring adequate resources to end violence against children remains the primary

responsibility of national governments, but the role played by ODA in promoting and leveraging national investments and budgets to end violence against children is crucial.

Progress in Agenda 2030's implementation is significantly lacking; it is critical to ensure that ODA is available and can play its acknowledged, catalytic role – especially in low-income countries. As such, it is also essential to monitor, understand, and ensure donors are making the right type and amount of investments.

In addition, further research is needed to understand the reasons for underreporting on EVAC-related targets in both development and humanitarian settings and how these gaps can be addressed.

3. ANALYSIS OF ODA TARGETING VIOLENCE AGAINST CHILDREN

METHODOLOGY

This report investigates the amount of project-level ODA targeted at ending violence against children – either as the main focus or as part of a broader programme. It is based on data from the OECD-DAC Creditor Reporting System (CRS) database.

This study uses the definition of violence against children, and definitions of the different forms of violence against children, as they appear in the Convention on the Rights of the Child; the United Nations Study on Violence against Children; the strategy of the Global Partnership to End Violence Against Children; and the strategies for ending violence against children described in the INSPIRE technical package.

Based on these definitions, relevant keywords were selected, and searches were applied on project titles and descriptions within the OECD-DAC CRS database. This was done in conjunction with applying purpose and channel code data to identify projects that are wholly or partially targeting children's issues. Further keyword searches were then carried out to identify projects that potentially targeted some aspect of ending violence against children.¹⁵

¹⁵ See Appendix B

The selected project records were then manually analysed to eliminate 'false positives' (e.g., records whose descriptions matched one or more keywords but which, on further examination, were not linked to action on ending violence against children).

The remaining records were categorised either as:

1. Projects that were entirely aimed at the prevention of, or response to, violence against children; and,
2. Projects for which ending violence against children was one among several other aims.

Additional analysis was performed to categorise EVAC spending according to the seven INSPIRE strategies and a combination of keyword searches was conducted in four phases.¹⁶ Keywords were selected from the INSPIRE package associated with each of the seven strategies. Detailed information on methodology is available in Annex B and Appendix A.¹⁷

LIMITATIONS

As with previous *Counting Pennies* reports, our data limitations mean the figures generated in this report can only be taken as estimates. The lack of a specific code or markers to identify projects specifically targeting EVAC makes it challenging to generate the precise number of projects and estimate funds working towards stopping and preventing violence against violence. This means there is a possibility our results have overlooked projects which target EVAC, leading to an underestimation of investments made towards EVAC.

Another issue is that the methodology relies entirely on the use of keyword searches. The output for these searches is highly dependent on the quality, correctness, and completeness of the project description given by the title, short description, and long description fields.

Finally, this report tracks actual spending reported by donors and not the commitments made to EVAC that will be spent over several years.

Channels of Funding

Projects funded by ODA are implemented and delivered through numerous partners, including government agencies (both donor and recipient governments), multilateral bodies, national and international NGOs, academic institutions, private sector actors, etc. The data from 2020 shows that the majority of total ODA spent on ending violence against children is channelled through international organisations, such as UNICEF, as well as donor-country-based (international) NGOs.^{19,20} Under 4% of ODA spent on ending violence against children was channelled through national (i.e., those based in the developing country) NGOs.

FIGURE 9. EVAC spending per top 10 channels
USD million 2020 prices (percentage of total)

Source: Authors' analysis of OECD CRS ODA 2020 database

Sectoral Spending

Spending on ending violence against children is usually spread across several sectors, as many efforts to address violence against children require multisectoral interventions. For example, spending on child protection activities is usually listed under 'other social services' in the DAC database.

¹⁹ To avoid double counting, UNICEF is analysed separately as a channel of funding and as a donor.

²⁰ In 2020, UNICEF reported **US\$712 million** as total expenses in child protection. The discrepancy in figures is due to:

1. Not all UNICEF funding for child protection can be classified as ODA; and
2. UNICEF child protection funding includes projects addressing issues that are not considered violence against children, such as childcare reform and birth registration. For more details see: <https://www.unicef.org/reports/global-annual-results-2020-goal-area-3>

ANNEX A:

METHODOLOGY FOR

EVAC ANALYSIS

Any attempt to measure aid spending towards ending violence against children can only be an estimate. There is always an added complexity because there are no codes or markers in any of the available databases to identify projects that target EVAC aid spending.

This study uses a combination of codes and keyword analysis of the long description, short description and the project title in the OECD-DAC CRS database.

The methodology used for this report largely emulates the methodological framework used in the 2017 *Counting Pennies* report, which analysed the OECD-DAC CRS 2015 database. This report also analyses EVAC aid spending towards INSPIRE-type strategies, using the methodological framework designed and developed by students from the London School of Economics and Political Science (LSE) – School of Public Policy’s (SPP) Master of Public Administration, as a part of their Academic Capstone report. The students analysed the OECD-DAC CRS 2017 database.

A.1.1 METHODOLOGY FOR IDENTIFYING EVAC-TARGETED PROJECTS

In short, the methodology used for identifying projects that target ending violence against children is as follows:

1. Select all records coded in the CRS database relating to the prevention and demobilisation of child soldiers; this is the one aspect of ending violence against children that has a separate code in the database.
2. Using a computer algorithm, a combination of donor codes, channel of delivery codes and keyword searches, to identify the remaining records that relate to projects aimed wholly or partially at children (e.g., girls, boys, childhood, etc.) in five different languages: English, French, Spanish, German, and Dutch.²¹
3. Check the project descriptions of the records identified in Step 2. Identify those containing one or more violence-related keywords (e.g., abuse, harm, labour, etc.) and run them through the algorithm – again in the same five languages.²² These keywords were based on the strategy documents of the Global Partnership to End Violence Against Children.
4. Manually analyse the output records from Step 3 and categorise as either:
 - False positive – not an EVAC-related project, despite the presence of one or more keywords
 - Ending violence against children-specific – a project that appears to be entirely EVAC-related
 - Ending violence against children and other groups – e.g., a project targeting violence against women and children
 - Ending violence against children and other child-related issues – a project that is focused on children, but incorporates both EVAC-related and non-EVAC-related activities

²¹ Complete list of keywords in Appendix B

²² Complete list of keywords in Appendix B

- A project that targets violence against children and other groups and non-EVAC-related activities
- Unknown – projects where the recorded description leaves a high level of uncertainty as to how it should be categorised.
- Include full funding for the project identified as specific and as related to EVAC.

A.1.2 EVAC CATEGORISATION FOR THE OECD-DAC CRS 2020 DATABASE

FIGURE 22. Total number of records by EVAC category and year

A.2 METHODOLOGY OF INSPIRE ANALYSIS

The methodological framework to categorise EVAC projects according to the INSPIRE strategies is also based on keyword searches. The keywords used are based on the INSPIRE strategy resources published by the World Health Organization, with the process taking place in four phases:

1. General/broad keyword search

To get the maximum number of observations out of the EVAC projects (e.g., law, norm, environment, etc.).²³ Each keyword in this step responds to the strategy it is targeting. For example, INSPIRE strategy '1' aims to strengthen and implement the law relating to child violence; thus, the algorithm looks for those EVAC records that exactly match the keyword 'law' and which are assigned to this strategy.²⁴

2. Focused keywords for each strategy

The second round of keyword searches is conducted on those observations that were assigned an INSPIRE-type strategy in the first step. This additional filter is intended to provide

²³ Complete list of keywords for each INSPIRE step in Appendix B

²⁴ NB: the INSPIRE automated keyword search was run only on projects in English.

a more accurate focus to categorise the EVAC projects appropriately. This is achieved by picking keywords from the approach and general description available in the package, e.g., looking for specific words such as 'enforcement', 'punish', 'banning', etc. on records that matched the word 'law' in the first step.

- The INSPIRE strategy is not necessarily sensitive to interventions in humanitarian contexts, thus keywords related to humanitarian action are systematically added at this stage to capture as many projects as possible.

3. Targeted keyword search

Run for precision: very specific keyword searches are run on this streamlined set of records from the first two steps. For instance, if the algorithm found the keyword 'law' and any of the keywords from

the second round, it will look for another set of keywords in these records.

4. Manual analysis of the records

To identify EVAC-specific and related projects which could be part of one or more of the seven INSPIRE strategies records were analysed manually.

- If the project contains one or more INSPIRE-type strategy, according to the individual understanding of the research team members, it was determined which strategy had more weight and was coded under that criterion. For accounting terms, the money spent on each of those strategies was considered and split equally; if a US\$10 million project was classified within two INSPIRE-type categories (enforcement of law and education, for instance) US\$5 million was assigned to each strategy.

AID SPENDING TO EVAC: METHODOLOGY

Primary objective: identify only those records on the Creditor Reporting System (CRS) of 2020 database (April 2022 update) which could be associated to EVAC activities

INSPIRE: METHODOLOGY

Primary objective: categorise all EVAC records resulting from EVAC methodology into INSPIRE Strategies. Design of a new framework to classify the projects by developing an automated three-step keyword searches
